

## Distribution Priority Option from JVC

JVC's newly developed Distribution Priority Option for JPEG streams allow users to allocate frame rates and user access to selected monitors, enabling users to ensure that a constant stream of important video information is not diluted by other non-essential viewers.

The monitoring options, which feature on JVC's VN-V225VPU and the VN-X235VPU, will consist of Priority to Client Number and Priority to Frame Rate enabling users to control the distribution of information.

The Priority to Client Number automatically adjusts the frame rate according to the number of clients accessed and assures distribution of up to 20 clients.

The Priority to Frame Rate always maintains at a requested frame rate by clients, though the number of clients is limited by requested frame rate and restricts streaming to a limited amount of users.

JVC's Distribution Priority Options on the VN-V225VPU and the VN-X235VPU will ensure reliable and stable surveillance for multiple users.
